

SAAD WAJID

Solihull, United Kingdom

+44 7471 757287 saadwajid401@gmail.com linkedin.com github.com

Education

Coventry University

Third Year Bachelor in Computer Science with Artificial Intelligence

Sep. 2024 – Now

Coventry, UK

Relevant Coursework

- Artificial Intelligence
- Software Engineering
- Operating Systems
- Theory of Computation
- Data Science
- Advanced Algorithms
- Computer Networks
- Working with Data

Experience

The FAS Solutions

April 2025 – September 2025

AI Engineer Apprentice

Remote

- Built a full-stack Flask expense tracking web application to manage and categorise user expenses, with backend APIs and persistent data storage.
- Developed an AI-powered receipt processing feature that automatically extracted expense information (e.g., merchant, date and amount) from uploaded receipt images.
- Trained a custom computer vision model for receipt field detection using annotated real-world receipt datasets and synthetically generated training data to improve model robustness.
- Applied OpenCV for image preprocessing and OCR pipeline integration, including text region detection and extraction from receipt images.
- Created synthetic receipt datasets programmatically to augment limited training data.
- Worked under senior engineer mentorship to complete practical AI engineering projects, gaining experience in backend development, model training workflows, and production-oriented application design.
- Designed and implemented end-to-end ML workflow including data collection, preprocessing, model training, inference integration, and user-facing deployment.

Projects

Conservation Platform | Flask, Javascript, HTML, CSS, SQLite

- Built a full-stack Flask web application for environmental conservation education, enabling students and teachers to collaborate through shared learning activities.
- Developed secure user authentication and role-based access control, allowing students to submit contributions while teachers could assign tasks, review submissions, and grade student work.
- Implemented interactive frontend features using JavaScript, HTML, and CSS, including dynamic content updates and user-friendly dashboards for different user roles.
- Designed and prototyped the platform UI/UX in Figma before implementation, creating a polished and responsive interface for desktop users.
- Integrated database-backed content management to support user-generated posts, assignment tracking, and contribution history across the platform.

Distributed IoT Security System | Python, MQTT, Multithreading

- Developed a distributed smart home security system in Python using the MQTT protocol to enable real-time communication between simulated sensors, controllers, and monitoring modules.
- Implemented multiple interconnected modules representing motion detectors, thermostats, alarms, and safety actuators, communicating through a central message broker.
- Used Python multithreading to simulate concurrent operation of independent hardware devices, allowing multiple sensor and control processes to run simultaneously across separate terminal instances.
- Designed automated event-driven responses to security and safety threats, including triggering alarms, activating barriers, flashing lights, and simulating fire suppression systems.

Technical Skills

Languages: Python, Javascript, C, C++, HTML, CSS, JavaScript, SQLite, Bash, Assembly, MatLab

Frameworks & Libraries: Flask, NumPy, Pandas, Scikit-Learn, OpenCV, MQTT,

Developer Tools: GitHub, VS Code, Figma, Linux

Certifications

Draft, analyse, and present with Microsoft 365 Copilot — Microsoft

May 2026

Azure AI Fundamentals — Microsoft

June 2026
