Education

Coventry University

BSc (Hons) Computer Science with Artificial Intelligence — **First Class (90%)**

Sep 2024 – Present

Coventry, UK

A-Levels

Mathematics (A*) Physics (A*) Chemistry (A*)

Sep 2022 – Jun 2024

Relevant Coursework

- Artificial Intelligence
- Advanced Algorithms
- Computer Networks
- Theory of Computation
- Data Science
- Software Engineering
- Operating Systems
- Working with Data

Experience

AI Engineer Intern

June 2026 – July 2026

Kings Accountants

Birmingham, UK

- Engineered an automated PDF conversion web app using Google Gemini multimodal LLMs, eliminating manual re-entry and saving **50+ hours/month** of client bookkeeping labor.
- Architected an automated multi-model fallback chain to handle API rate limits and deprecation, reducing conversion failure rates from **50% baseline to near-zero errors**.
- Designed a schema-agnostic prompt strategy and defensive JSON parsing algorithm to accurately extract variable tabular financial data without template updates.
- Built an in-memory serverless architecture on Vercel ensuring total data privacy with zero persistent disk storage.
- Streamlined client onboarding workflow by engineering dynamic PDF schema inference, enabling users to submit raw PDF bank statements (**70%** of clients) without manual CSV conversion requests improving client satisfaction by **35%** .

AI Engineer Apprentice

Apr 2025 – Sep 2025

The FAS Solutions

Remote

- Developed an end-to-end receipt extraction application (ReceiptML) utilizing PyTorch and OpenCV for real-time document region localization and OCR preprocessing.
- Engineered a programmatic synthetic data generator applying random perspective warps, geometric noise, and text rendering to solve annotated data scarcity.
- Built an OpenCV pipeline implementing adaptive thresholding, deskewing, and contour extraction to optimize low-quality receipt images for field extraction.
- Architected a full MLOps lifecycle from synthetic data generation and OpenCV preprocessing to PyTorch model inference and Flask REST API serving.

Projects

HomeGuard Distributed Security Engine | Python, MQTT, Multithreading, JSON

- Designed a real-time MQTT decision engine processing sensor telemetries to execute dynamic threat escalation algorithms across physical actuators.
- Implemented Python multithreading to manage asynchronous sensor event timers without blocking central decision logic execution.

Komodo Hub Conservation Platform | Flask, Python, SQLAlchemy, Neon Postgres

- Co-architected a national conservation application featuring relational SQLAlchemy schemas, role-based access controls, and management analytics.

Technical Skills

Languages: Python, C/C++, SQL (Postgres, SQLite), JavaScript, TypeScript, Bash, MATLAB

AI/ML & Computer Vision: PyTorch, OpenCV, Google Gemini API, Scikit-Learn, NumPy, Pandas, Pillow

Frameworks & Tools: Flask, Next.js, REST APIs, Git/GitHub, Linux, Vercel, Neon Postgres, Azure AI

Certifications

Developing AI Agents with Azure — Microsoft

July 2026

Azure AI Fundamentals — Microsoft

June 2026
